Shock Sensation Stimulator

The Shock Sensation Stimulator is an effective tool for behavioral modification. The device utilizes an isolated and regulated alternating current source to provide a safe yet effective electrical stimulation with sufficient source potential to ensure consistent negative reinforcement conditioning for almost any subject. The level of discomfort is adjustable to obtain adequate deterrent value without being unnecessarily cruel or traumatic.

The stimulator provides four individually controlled output channels with each channel having its own diagnostic bar-graph for detecting electrical problems and monitoring the actual stimulus delivered. The diagnostic bar-graph and precision current regulation ensure the electrical integrity of the system and eliminate inconsistencies experienced with similar products.
